

Library use

Follow the next steps to use the library:

1. Install the JDK software
 - a. Go to <http://www.oracle.com/technetwork/java/javase/downloads/jdk8-downloads-2133151.html>
 - b. Select the last JDK software, click Download and install it
2. Create a folder called "lib" inside the root folder of the project
3. Put the jar of the library inside the folder lib
4. Copy all the jars contained inside the lib folder of the library to the created folder:

5. Create a file called config.properties inside the root folder of the project
 - a. Add a property called java.home, the value of this property must point to the JRE inside the JDK
 - b. Add a property called source.path, the value of this property must point to the folder that contains the source code of the classes

6. Configure the virtual machine arguments to use the library as java agent. The configuration depends on where you are executing the application. Anyway, you must add the next parameter:
-javaagent:"lib/jmplib.jar"

NOTE: There are available examples of use and execution in the JMPLibExamples project. The examples can be executed by command line or Eclipse IDE.
